Features

Tabulator allows you to create interactive tables in seconds from any HTML Table, Javascript Array or JSON formatted data.

Simply include the library and the css in your project and you're away!

Tabulator is packed with useful features including:

 Filters Filter data to display only what you need to	 Sorting Sort data however you like, by any value or data type	 Formatting Create custom formatters to graphically display data	 Grouping Graphically group rows by any specified data
 Ajax Asynchronously load data into your table via Ajax requests	 Editing Edit table data directly in the table. Then return the result	 Callbacks Interact with Tabulator through a selection of callbacks	 Virtual DOM Lightning fast rendering of large data sets using a virtualized DOM
 CSS Styling All graphical elements are assigned classes for full CSS styling	 Pagination Automatic local and remote data pagination	 Packaged Themes Five Prepackaged themes straight out the box	 Mutators Alter data as it enters and leaves the table
 Accessibility Aria tags are used on all elements for enhanced readability	 Freeze Columns Freeze columns in place while scrolling	 Row Selection Select single or multiple rows with the mouse	 Localization Localize the content of your tables to multiple languages
 Download Data Download data directly from the table to a CSV or XLSX File.	 Layout Customise the layout of Tabulator to meet your needs	 Key Bindings Customisable keyboard shortcuts for table interaction	 Responsive Layout Automatically hide & show data to fit table size
 Persistent Layout Remember user layout preferences between visits	 History Record user interactions and Undo or Redo actions	 Navigation Navigate focus around the table with keyboard and functions	 Column Calculations Calculate max, min, avg, & sum values from column data

Frontend Framework Support

Tabulator is built to work with all the major front end JavaScript frameworks including React, Angular and Vue.

Setup

Setting up tabulator could not be simpler.

Include the library and the css

```
<link href="dist/css/tabulator.min.css" rel="stylesheet">
<script type="text/javascript" src="dist/js/tabulator.min.js"></script>
```

Create an element to hold the table

```
<div id="example-table"></div>
```

Turn the element into a tabulator with some simple javascript

```
var table = new Tabulator("#example-table", {});
```

Bower Installation

To get Tabulator via the Bower package manager, open a terminal in your project directory and run the following command:

```
bower install tabulator --save
```

NPM Installation

To get Tabulator via the NPM package manager, open a terminal in your project directory and run the following command:

```
npm install tabulator-tables --save
```

CDN - UNPKG

To access Tabulator directly from the UNPKG CDN servers, include the following two lines at the start of your project, instead of the locally hosted versions:

```
<link href="https://unpkg.com/tabulator-tables/dist/css/tabulator.min.css" rel="stylesheet">  
<script type="text/javascript" src="https://unpkg.com/tabulator-tables/dist/js/tabulator.min.js"></script>
```
